

Fact Sheet

FATAL INJURIES AMONG LANDSCAPE SERVICES WORKERS

Working in teams can reduce the risks of occupational injuries and fatalities.

Overview

An average of 197 landscape services workers¹ died from on-the-job injuries each year between 2003 and 2006². The fatality rate for the landscape services industry, about 25 deaths per 100,000 workers, is similar to that for more recognized high-risk industries such as agriculture and mining. Although landscape services workers make up 0.8% of the U.S. workforce, they experienced 3.5% of the total occupational fatalities.

Landscape services workers complete jobs such as landscape and irrigation installation, lawn care, tree removal, general landscape maintenance and snow removal.

Workforce

Landscape services workers numbered slightly more than 1 million workers in the U.S in 2006. The Bureau of Labor Statistics (BLS), U.S. Department of Labor, estimated over 924,000 landscaping and groundskeeping workers plus 110,000 first-line supervisors for those workers across all industries. The landscape services industry employed approximately 680,000 workers in 2006. The remaining 300,000+ landscape services workers were employed in other industries such as golf courses, resorts, public parks, and schools. Forty-one percent of landscape services workers in 2006 were Hispanic or Latino in comparison with 16% of the total U.S. workforce. (www.bls.gov/cps/cpsaat11.pdf)

Occupational Fatalities

BLS Census of Fatal Occupational Injuries (CFOI) identified 789 deaths due to traumatic injuries among landscape services workers and their first-line supervisors between 2003 and 2006. In each of these years, 25 to 30% of these workers who died were identified as self-employed. About 56% of the fatalities occurred among white workers, 29% among Hispanic and Latino workers and 11% among Black or African American workers. (<http://www.bls.gov/iif/oshcfoi1.htm>) Nearly 80% of the landscape services worker fatalities occurred in the landscape services industry.

The most common event resulting in landscape services worker fatalities was transportation incidents (Figure 1). About 33% of all landscape worker fatalities were due to transportation

Table 1. Activities at the Time of Landscape Services Worker Fatalities, 2003 - 2006

Activity	Fatalities
Using/Operating Tools or Machinery (during trimming or removing trees)	355 (288)
Vehicle or Transportation Operations	241
Constructing, Repairing, Cleaning	103
Physical Activity, n.e.c.	46
Other Activities	44

incidents in comparison with 43% for all U.S. industry. Landscape services workers were more likely to die due to falls to lower level, struck by falling objects, and electrocutions (22%, 17%, and 9.8%, respectively) than the overall U.S. workforce (12%, 6.3%, and 4.4% respectively).

Landscape services workers were engaged in a range of activities at the time of the occupational fatalities (Table 1). Using tools or machinery during tree trimming or removal activities was particularly hazardous. Fatalities during tree trimming or removal activities were caused by falls from heights, being struck by falling objects and electrocutions. Information is not available to determine if the workers trimming or removing trees were employed by tree services companies or other landscaping services companies. Most landscape services worker fatalities occurred on private property with the largest proportion at private residences (Figure 2). Decentralized job sites, like those listed for these fatalities, are associated with reduced organizational and infrastructure support for safe and healthful work practices.

Figure 2. Locations where landscape services worker fatalities occurred, 2003 – 2006.

LANDSCAPE SERVICES WORKERS

Transportation-related fatalities for landscape services workers and their first-line supervisors for 2003 – 2006 are compared with total fatalities by month in Figure 3. The numbers of total and transportation related fatalities were generally greater in May through September than in the remaining months.

Figure 3. Numbers of total and transportation-related fatalities among Landscape Services workers and First-Line Supervisors, by month, for 2003 – 2006

Endnotes

1. Landscape services workers includes these Standard Occupational Classifications: Landscaping and Groundskeeping Workers (37-3011), Tree Trimmers and Pruners (37-3013), Grounds Maintenance Workers, All Other (37-3019), and First-Line Supervisors/Managers of Landscaping, Lawn Service, and Groundskeeping Workers (37-1012).
2. The Census of Fatal Occupational Injuries preliminary data for 2006 were used for the analysis included in this document. The final 2006 data identified four more landscape services worker fatalities.
3. Contact with objects or equipment includes struck by, struck against, and caught in or compressed by objects or equipment.
4. Exposure includes temperature extremes, contact with electric current, exposures to substances including animal venoms, and oxygen deficiencies, e.g., drowning.

Prevention of Traumatic Injury Fatalities

Most, if not all, occupational fatalities are preventable through hazard recognition and control, effective employee training, and appropriate selection and use of personal protective equipment. Some general guidance for prevention of traumatic injuries is given below. Guidance for specific hazards and training materials in both English and Spanish can be obtained free of charge through the internet addresses below. Many of the training documents are designed for tailgate training sessions. Many OSHA and NIOSH documents list recommended practices to reduce injury risks from specific landscape services hazards.

General Guidance

- Understand and comply with all OSHA regulations that apply to the landscape services operations and tasks.
- Develop, implement and enforce a comprehensive safety program that includes written rules and safe work procedures. A joint health and safety committee with employees & supervisors should be considered.
- Conduct an initial and daily jobsite survey before beginning work to identify all hazards and implement appropriate controls.
- Provide specific training for hazards such as power lines and other sources of electricity, tree trimming and felling, falls from heights, roadway vehicle operations, and hand and portable power tools use.
- Train operators of off-road machinery and other specialized equipment to follow manufacturers' recommended procedures for safe operation, service, and maintenance.
- Monitor workers during periods of high heat stress/strain and remind workers of the signs of heat-related illness and the need to consume sufficient water during hot conditions.
